Post-Harvest Loss Reduction

Mycotoxins

- Compounds produced by a range of fungi, toxic to human health
- Contaminate crops broadly
- Carry over into animal-sourced foods

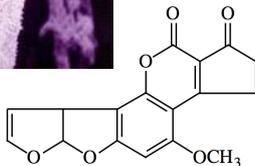

Photo: Karanja,
KALRO

Aflatoxin

- Produced by *Aspergillus* fungi
- Infect a range of crops
- Invisible/difficult to detect or sort
- Toxic to humans and animals (livestock)
 - Carcinogenic
 - Associated with
 - Stunting
 - Immunosuppression
 - Blocking nutrient absorption

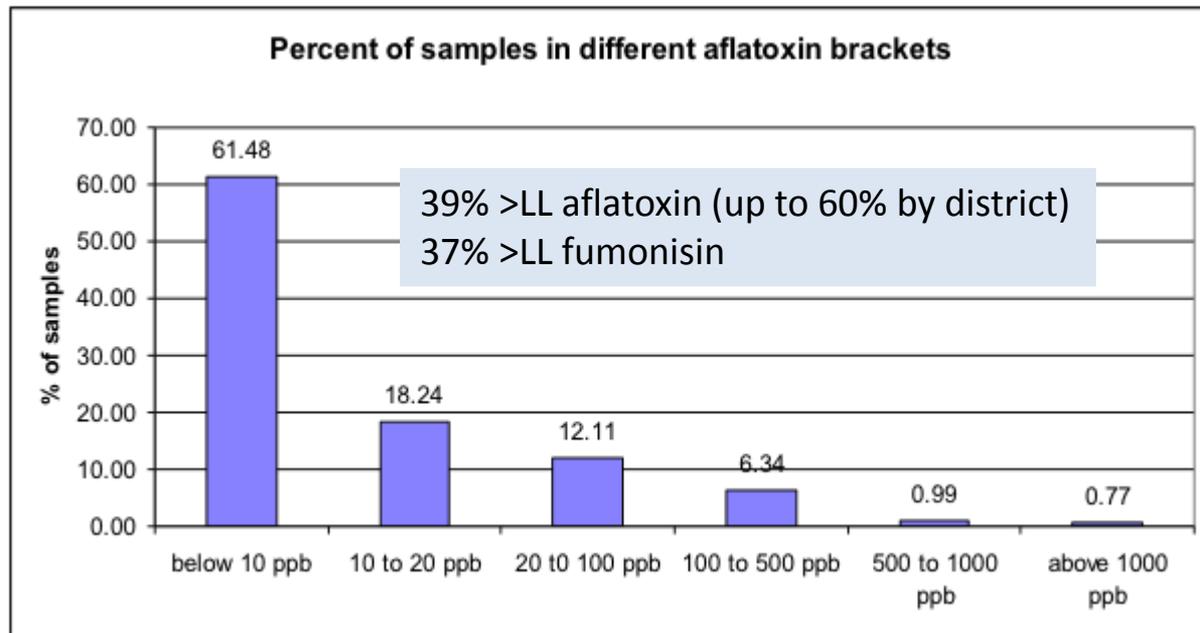

Kenya alert over 2.3m bags of bad maize

Aflatoxin risk determined by:

Host: crop species and variety/type

x Fungal population

x Crop management in field

x *Environmental conditions*

x Postharvest practices

To reduce aflatoxins for all farmers and consumers, reducing risk and addressing contamination along the value chain is essential.

Targeting appropriate interventions:

Prevention – reduce risk from field to consumption

Surveillance and response – when conditions have eclipsed interventions' effective range

Preharvest:

Biocontrol: competitive exclusion

Good agricultural practices: adoption incentive includes higher yield

- Reduce biotic and abiotic crop stress (e.g., drought, nutrient stress)
- Use appropriate varieties for agroecologies
- Planting time
- Intercropping, crop rotation, tillage, fertilizer
- Planting less susceptible crops

Periharvest: harvest time, avoid soil contact

Postharvest:

adoption incentive includes reduce losses

- *Testing → decontamination and alternative uses*
- Proper drying | **Moisture content (measurement)**
- Proper storage
- *Testing → decontamination and alternative uses*

(Surveillance to predict hotspots near harvest time: modelling and mobile diagnostics - appropriate sampling)

Post-harvest losses

- Losses in quantity and quality, including economic losses.
- Estimated ~1/3 loss in developing countries
- Scant evidence base – weak methodologies
- Many interventions available, off the shelf or used elsewhere
- Limited focus on gender – key for development
- Limited success and impact to date *relative to*
- Tremendous promise to address food security

Feed the Future Innovation Lab for the Reduction of Post-Harvest Loss

Technical focus areas:

- drying
- storage
- insect pests, mycotoxins

Cross-cutting:

- capacity building (universities, government; lab, curriculum, extension,...)
- nutrition
- gender

FtF Innovation Lab: Post-Harvest Loss

Success 1: novel/adapted drying technologies

Success 2: adapted storage technologies

Success 3: low cost moisture meter

Additional considerations:

e.g., Pathway to impact (actors,...),

The road ahead

KANSAS STATE
UNIVERSITY

A close-up photograph of a person's hand holding several garlic cloves. The hand is positioned palm-up, and the garlic cloves are scattered across it. Some of the garlic cloves are covered in a thick, green, fuzzy mold, while others are clean and white. The background is a soft, out-of-focus brown color. The text "Towards integration of mycotoxin reduction strategies" is overlaid in the center of the image in a bold, black, sans-serif font.

**Towards integration of
mycotoxin reduction strategies**

Critical gaps – addressing mycotoxins

- Good quality baseline information
- In country technical capacity
- Standardized sampling and testing procedures
- Surveillance tools: mobile diagnostics, modelling and mapping
- Alternative uses, decontamination
- Understanding the full scope of health risks

- Empowering and working in coordination with national partners
- Assessing a baseline *along with* potential interventions
- Appropriate interventions (context, cost, gender considerations,...)

- Involve private sector and regulators co-regulation? →
- Importance of risk communication
- Given geographic, biological, environmental and socioeconomic complexity, have a range of interventions available
